Exercise 2.5

Model update:

The model from exercise 2.3 has the following attributes:

-name

-ingredients

-cooking_time

-description

For this exercise, I will need to add the attribute 'pic' in order to add a photo for each recipe. I will also need to include a default image when one isn't uploaded. As for functionality, I need to add a 'calculate_difficulty' function to calculate the recipe difficulty. This won't need to be stored as an attribute as it will be created once the recipe has been made. It will be called later with the templates when the recipes list is rendered.

Frontend Inspirations:

My favorite recipe app, and really the main one I use besides a 'Google search', is the NYT Cooking site. It has an incredible selection of recipes however the layout is white with typically one photo of the finished dish. For this project, I want to use a background photo to spice things up with some content, in order to make the app a bit more interesting, rather than just a white background. My focus will be on using wood as a theme, as I think it gives a warm and calming appearance, being as it's a natural product.
